Introduction

Fix
$$\xi \in \mathbb{R} \setminus \overline{\mathbb{Q}}$$
. Recall that for each $\mathbf{x} = (x_0, \dots, x_n) \in \mathbb{R}^{n+1}$

$$L_{\xi}(\mathbf{x}) = \max\{|x_0\xi - x_1|, \ldots, |x_0\xi'' - x_n|\}.$$

 $\hat{\lambda}_n(\xi)$ is the supremum of the reals numbers $\lambda \geq 0$ such that

$$\|\mathbf{x}\| \leq X$$
 and $L_{\xi}(\mathbf{x}) \leq X^{-\lambda}$

has a non-zero solution $\mathbf{x} \in \mathbb{Z}^{n+1}$ for each large enough X.

Theorem (P.-Roy, 2021)

$$\hat{\lambda}_n(\xi) \leq rac{1}{n/2 + a\sqrt{n} + 1/3}$$
 where $a = (1 - \log 2)/2 \cong 0.153$ for $n \geq 2$.

Definition

Let $j, \ell \in \{0, \ldots, n\}$. We say that property $\mathcal{P}(j, \ell)$ holds if

$$\dim \mathcal{U}^\ell(A_m(i)) \geq \ell + 1 + m \quad (m = 0, \dots, j)$$

for each sufficiently large integer $i \ge 0$.

- $\mathcal{P}(j,\ell) \Rightarrow \mathcal{P}(j-1,\ell) \text{ if } j > 0.$
- $\mathcal{P}(n,0)$ holds since $\mathcal{U}^0(A_m(i)) = A_m(i)$ has dimension m+1.
- If $\hat{\lambda}_n(\xi) > 1/(n-\ell+1)$, then $\mathcal{P}(0,\ell)$ holds (BS, 2021).
- $\mathcal{P}(j,\ell) \Rightarrow \mathcal{P}(j+1,\ell-1)$ (properties of $\ell \mapsto \dim \mathcal{U}^{\ell}(A)$).

Growth's estimates

Proposition E

Suppose that $\mathcal{P}(j, \ell)$ holds for some integers $1 \leq j \leq \ell < n$. Then, for each $i \geq 0$, we have

$$Y_j(i)^{(\ell-j+1)\lambda} \ll Y_{j-1}(i) \Big(\prod_{m=1}^{j-1} Y_m(i)^{-2\lambda}\Big) Y_0(i)^{-\lambda}$$

Growth's estimates

Proposition E

Suppose that $\mathcal{P}(j, \ell)$ holds for some integers $1 \leq j \leq \ell < n$. Then, for each $i \geq 0$, we have

$$Y_{j}(i)^{(\ell-j+1)\lambda} \ll Y_{j-1}(i) \Big(\prod_{m=1}^{j-1} Y_{m}(i)^{-2\lambda}\Big) Y_{0}(i)^{-\lambda}.$$

Corollary

Suppose that $\mathcal{P}(j, \ell)$ holds for some integers $1 \leq j \leq \ell < n$, and that $\theta^{j-1} + \theta^j \geq 1$, where $\theta = \ell \lambda / (1 - \lambda)$. Then we have $Y_m(i)^{\theta} \ll Y_{m-1}(i)$ for each $i \geq 0$ and each $m = 0, 1, \ldots, j$.

Suppose that $\mathcal{P}(j, \ell)$ holds for some integers $1 \leq j \leq \ell < n$, and that $\theta^{j-1} + \theta^j \geq 1$, where $\theta = \ell \lambda / (1 - \lambda)$. Then we have $Y_m(i)^{\theta} \ll Y_{m-1}(i)$ for each $i \geq 0$ and each $m = 0, 1, \ldots, j$.

Ingredients for Proposition E: an alternative height estimate.

- V has m + 1 (with m as large as possible) points among $\mathbf{x}_{r}^{(0,\ell)}, \ldots, \mathbf{x}_{r}^{(\ell,\ell)}$ to make L_r (and thus $Y_j(i)^{-\lambda}$) appear in the upper bound for H(V);
- $U \cap V = \langle \mathbf{x}_r^{(0,\ell)} \rangle$ (to control the height of the intersection).

Write g = gcd of the coordinates of $\mathbf{x}_r^{(0,\ell)}$.

Strategy and notation	First general height estimates	Proof of the theorem
		0000000

Solution. Schmidt's inequality $H(U + V)H(U \cap V) \ll H(U)H(V)$.

Construct U and V such that:

- $U + V = \mathcal{U}^{\ell}(A_j(i));$
- V has m+1 (with m as large as possible) points among x_r^(0,ℓ),...,x_r^(ℓ,ℓ) to make L_r (and thus Y_j(i)^{-λ}) appear in the upper bound for H(V);
- $U \cap V = \langle \mathbf{x}_r^{(0,\ell)} \rangle$ (to control the height of the intersection).

Write g = gcd of the coordinates of $\mathbf{x}_r^{(0,\ell)}$. Then we will have

 $H(U \cap V) \asymp g^{-1}X_r$ and $H(V) \ll g^{-1}X_r L_r^m \cdots \ll g^{-1}X_r Y_j(i)^{-m\lambda} \cdots$

Strategy and notation	First general height estimates	Proof of the theorem
		0000000

Solution. Schmidt's inequality $H(U + V)H(U \cap V) \ll H(U)H(V)$.

Construct U and V such that:

- $U + V = \mathcal{U}^{\ell}(A_j(i));$
- V has m+1 (with m as large as possible) points among x_r^(0,ℓ),...,x_r^(ℓ,ℓ) to make L_r (and thus Y_j(i)^{-λ}) appear in the upper bound for H(V);
- $U \cap V = \langle \mathbf{x}_r^{(0,\ell)} \rangle$ (to control the height of the intersection).

Write g = gcd of the coordinates of $\mathbf{x}_r^{(0,\ell)}$. Then we will have

$$H(U \cap V) \asymp g^{-1}X_r$$
 and $H(V) \ll g^{-1}X_r L_r^m \cdots \ll g^{-1}X_r Y_j(i)^{-m\lambda} \cdots$

Using Schmidt's inequality, it gives

$$H(\mathcal{U}^{\ell}(A_j(i)))g^{-1}X_r \ll H(U)g^{-1}X_r \frac{Y_j(i)^{-m\lambda}}{Y_j(i)}\cdots,$$

Strategy and notation	First general height estimates	Proof of the theorem
		0000000

Solution. Schmidt's inequality $H(U + V)H(U \cap V) \ll H(U)H(V)$.

Construct U and V such that:

- $U + V = \mathcal{U}^{\ell}(A_j(i));$
- V has m+1 (with m as large as possible) points among x_r^(0,ℓ),...,x_r^(ℓ,ℓ) to make L_r (and thus Y_j(i)^{-λ}) appear in the upper bound for H(V);
- $U \cap V = \langle \mathbf{x}_r^{(0,\ell)} \rangle$ (to control the height of the intersection).

Write g = gcd of the coordinates of $\mathbf{x}_r^{(0,\ell)}$. Then we will have

$$H(U \cap V) \asymp g^{-1}X_r$$
 and $H(V) \ll g^{-1}X_r L_r^m \cdots \ll g^{-1}X_r Y_j(i)^{-m\lambda} \cdots$

Using Schmidt's inequality, it gives

$$H(\mathcal{U}^{\ell}(A_j(i)))g^{-1}X_r \ll H(U)g^{-1}X_r \frac{Y_j(i)^{-m\lambda}}{Y_j(i)}\cdots,$$

hence $1 \ll H(U) Y_j(i)^{-m\lambda} \cdots$.

Problem. Find a condition so that $\mathcal{P}(j, \ell)$ holds.

<ロ> <四> <回> <三> <三> <三> <三> <三</p>

Problem. Find a condition so that $\mathcal{P}(j, \ell)$ holds.

Proposition F (Corollary of Proposition C)

Let j, ℓ with $2\ell + j \leq n$. Suppose that $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$. Then, there are infinitely many *i* such that

$$1 \ll H(\mathcal{U}^{\ell-1}(A_j((i)))L_{i-1}^m)$$
(1)

where $m = n - j - 2\ell + 2$.

Problem. Find a condition so that $\mathcal{P}(j, \ell)$ holds.

Proposition F (Corollary of Proposition C)

Let j, ℓ with $2\ell + j \leq n$. Suppose that $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$. Then, there are infinitely many *i* such that

$$1 \ll H(\mathcal{U}^{\ell-1}(A_j((i)))L_{i-1}^m)$$
(1)

where $m = n - j - 2\ell + 2$.

Since $\mathcal{P}(j, \ell - 1)$, we can use our estimate $H(\mathcal{U}^{\ell-1}(A_j(i)))$ as well as $Y_k(i)^{\theta} \ll Y_{k-1}(i)$ for $k = 0, \dots, j-1$.

Problem. Find a condition so that $\mathcal{P}(j, \ell)$ holds.

Proposition F (Corollary of Proposition C)

Let j, ℓ with $2\ell + j \leq n$. Suppose that $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$. Then, there are infinitely many i such that

$$1 \ll H(\mathcal{U}^{\ell-1}(A_j((i)))L_{i-1}^m)$$
(1)

where $m = n - j - 2\ell + 2$.

Since $\mathcal{P}(j, \ell - 1)$, we can use our estimate $H(\mathcal{U}^{\ell-1}(A_j(i)))$ as well as $Y_k(i)^{\theta} \ll Y_{k-1}(i)$ for $k = 0, \dots, j-1$. By (1)

$$1 \ll \left(Y_{j-1}(i)^{1-\ell\lambda}Y_{j-2}(i)^{-\lambda}\cdots Y_0(i)^{-\lambda}\right)Y_{-1}^{-m\lambda}$$
$$\ll Y_{j-1}(i)^{1-\lambda(\ell+\theta+\theta^2+\cdots+\theta^{j-1}+m\theta^j)}.$$

Problem. Find a condition so that $\mathcal{P}(j, \ell)$ holds.

Proposition F (Corollary of Proposition C)

Let j, ℓ with $2\ell + j \leq n$. Suppose that $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$. Then, there are infinitely many i such that

$$1 \ll H(\mathcal{U}^{\ell-1}(A_j((i)))L_{i-1}^m)$$
(1)

where $m = n - j - 2\ell + 2$.

Since $\mathcal{P}(j, \ell - 1)$, we can use our estimate $H(\mathcal{U}^{\ell-1}(A_j(i)))$ as well as $Y_k(i)^{\theta} \ll Y_{k-1}(i)$ for $k = 0, \dots, j-1$. By (1)

$$1 \ll \left(Y_{j-1}(i)^{1-\ell\lambda}Y_{j-2}(i)^{-\lambda}\cdots Y_0(i)^{-\lambda}\right)Y_{-1}^{-m\lambda}$$
$$\ll Y_{j-1}(i)^{1-\lambda(\ell+\theta+\theta^2+\cdots+\theta^{j-1}+m\theta^j)}.$$

Hence $\hat{\lambda}_n(\xi) \leq 1/(\ell + \theta + \dots + \theta^{j-1} + m\theta^j).$

- If $\mathcal{P}(j,\ell-1)$ holds but not $\mathcal{P}(j,\ell) \Rightarrow$ upper bound for $\hat{\lambda}_n(\xi)$.
- So, if $\mathcal{P}(j, \ell 1)$ holds and $\hat{\lambda}_n(\xi)$ is "large" enough, then $\mathcal{P}(j, \ell)$ holds. This gives another upper bound for $\hat{\lambda}_n(\xi)$ (height estimate of Proposition D).

By induction on j and with our choice of parameters, we show that there are ρ_n,ρ_n' such that

- if $\hat{\lambda}_n(\xi) > \rho_n$, then $\mathcal{P}(j, \ell)$ holds;
- if $\mathcal{P}(j,\ell)$ holds, then $\hat{\lambda}_n(\xi) \leq \rho'_n$.

Conclusion.

- If $\mathcal{P}(j,\ell-1)$ holds but not $\mathcal{P}(j,\ell) \Rightarrow$ upper bound for $\hat{\lambda}_n(\xi)$.
- So, if $\mathcal{P}(j, \ell 1)$ holds and $\hat{\lambda}_n(\xi)$ is "large" enough, then $\mathcal{P}(j, \ell)$ holds. This gives another upper bound for $\hat{\lambda}_n(\xi)$ (height estimate of Proposition D).

By induction on j and with our choice of parameters, we show that there are ρ_n,ρ_n' such that

- if $\hat{\lambda}_n(\xi) > \rho_n$, then $\mathcal{P}(j, \ell)$ holds;
- if $\mathcal{P}(j,\ell)$ holds, then $\hat{\lambda}_n(\xi) \leq \rho'_n$.

So $\hat{\lambda}_n(\xi) \leq \max\{\rho_n, \rho'_n\}.$

Conclusion.

- If $\mathcal{P}(j,\ell-1)$ holds but not $\mathcal{P}(j,\ell) \Rightarrow$ upper bound for $\hat{\lambda}_n(\xi)$.
- So, if $\mathcal{P}(j, \ell 1)$ holds and $\hat{\lambda}_n(\xi)$ is "large" enough, then $\mathcal{P}(j, \ell)$ holds. This gives another upper bound for $\hat{\lambda}_n(\xi)$ (height estimate of Proposition D).

By induction on j and with our choice of parameters, we show that there are ρ_n,ρ_n' such that

- if $\hat{\lambda}_n(\xi) > \rho_n$, then $\mathcal{P}(j, \ell)$ holds;
- if $\mathcal{P}(j,\ell)$ holds, then $\hat{\lambda}_n(\xi) \leq \rho'_n$.

So $\hat{\lambda}_n(\xi) \leq \max\{\rho_n, \rho'_n\}$. By optimizing the choice of ℓ and j, we get

$$\hat{\lambda}_n(\xi) \leq rac{1}{n/2 + a\sqrt{n} + 1/3}$$

Thank you.

Ideas of the proof of Proposition F

Since $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$, there are infinitely many *i* s.t.

 $\dim(\mathcal{U}^{\ell}(A_i(j))) = \ell + j.$

Ideas of the proof of Proposition F

Since $\mathcal{P}(j, \ell - 1)$ holds but not $\mathcal{P}(j, \ell)$, there are infinitely many *i* s.t.

$$\dim(\mathcal{U}^{\ell}(A_i(j))) = \ell + j.$$

By Proposition B (see first part of the talk), we have

$$H(\mathcal{U}^{\ell-1}(A_i(j))) \asymp H(V)^m,$$

where $m = n - j - 2\ell + 2$ and $V = U^d(A_j(i))$ (with $d = n - \ell - j$) is an hyperplane of $\mathbb{R}^{\ell+j+1}$.

$$\dim(\mathcal{U}^{\ell}(A_i(j))) = \ell + j.$$

By Proposition B (see first part of the talk), we have

$$H(\mathcal{U}^{\ell-1}(A_i(j))) \asymp H(V)^m,$$

where $m = n - j - 2\ell + 2$ and $V = U^d(A_j(i))$ (with $d = n - \ell - j$) is an hyperplane of $\mathbb{R}^{\ell+j+1}$.

Without loss of generality (easy technical argument), we can assume $\mathcal{U}^d(\mathbf{x}_{i-1}) \not\subset V$, so that

 $1 \ll H(V)L_{i-1}.$

where $m = n - j - 2\ell + 2$ and $V = U^d(A_j(i))$ (with $d = n - \ell - j$) is an hyperplane of $\mathbb{R}^{\ell+j+1}$.

Without loss of generality (easy technical argument), we can assume $\mathcal{U}^d(\mathbf{x}_{i-1}) \not\subset V$, so that

$$1 \ll H(V)L_{i-1}.$$

Raising to the power *m*, we get $1 \ll H(\mathcal{U}^{\ell-1}(A_i(j)))L_{i-1}^m$.
